

AUTOMATED FILE DELIVERY

BENEFITS:

1. Get your completed data project returned to you earlier.
 2. We place the data back on your server saving you time and work.
-

SECURE DATA TRANSMISSION

- Anchor uses the latest Microsoft Windows Operating Systems, Verisign Secure Site Certificates, Norton Anti-Virus Software, and PGP file encryption to provide the foundation for our eCommerce System security.
 - All data (depending upon client policies and capabilities) transmitted over the Internet is encrypted using Microsoft 128-bit SSL Secure Socket Layer (SSL) and a Verisign 128-bit Secure Server Certificate.
 - Completed files processed are stored in ".ZIP" format with password protection. An email with the password is sent to you when processing has completed and the file is then transmitted securely.
 - Additionally, we offer you a PGP encryption option to further encrypt your files prior to transmission/or receipt by Anchor.
-

PRO-ACTIVE NETWORK MONITORING

- Anchor's IT professionals constantly monitor our network and automated transaction system. Our pro-active monitoring includes:
 - Monitoring and reacting to possible security breaches.
 - Analyzing Firewall logs.
 - Researching and implementing the latest software revisions, patches, service packs, and virus definitions.
 - Anchor conducts audits of our eCommerce system. These audits include the use periodically of "ethical hackers" to identify and isolate potential vulnerabilities.
